## Diamon-Fusion International Introduces New FuseCube Express™

**Irvine, California, March 17, 2020:** Meet the FuseCube Express: DFI's newest evolution of the FuseCube. It's small, yet powerful. Fast and compact. And here to help your business grow.

Standing on the shoulders of the original FuseCube, the FuseCube Express packs all the same great capabilities of the original FuseCube, now within a minimal footprint and compact design. It's geared to keep pace with any sized glass processor through quick run cycles, small load capacity, and unique design components making a great fit for small to large manufacturers.

### Key new features:

**Treats 1-5 lites:** Lets you get orders out faster

**Less than 10-minute cycles:** Allows for seamless production flow

**Minimal footprint:** Saves floor space at 5 ft. wide and 6 ft. in length

**New multi-run cartridges:** Runs five cycles for ease of operation

## **Fuses Diamon-Fusion protective coating onto the glass**

As with DFI's other automated machines, the FuseCube Express fuses Diamon-Fusion onto both sides of the glass through a proprietary chemical vapor deposition (CVD) process – transforming it into a high-performing, water-repellent surface. The invisible chemical bond created prevents water stains and preserves glass for years to come, adding proven value.

### **Quote from Carl Christ, VP of Technical Services and Business Development**

“We designed the FuseCube Express for fabricators whose production flow requires their glass be treated quickly. The machine can treat one to five pieces of glass at a time and can even accommodate larger pieces, all without having to change the cartridges after each cycle. It's yet another innovative piece of equipment from DFI that adds value to your bottom line.”
